PHASE 2: REQUIREMENT ANALYSIS

1. Functional Requirements:

a) User Input Module:

The user can select the document type from three options: Employment Contract, NDA, and Lease Agreement. The user will enter details like party names, roles, terms, and dates through a simple form.

b) AI Generation Module:

The system will use Gemini 1.5 Pro API to generate the legal document. The prompt will include the document type and all user-entered details to ensure accuracy.

c) Document Editing Module:

After generation, the user can edit the content directly in the application before downloading. This provides flexibility to add or remove clauses.

d) Multi-Format Download Module:

The user can download the final document in three formats: TXT, DOCX, and PDF. The DOCX format includes a branded header, footer, and company logo, and formats key details in a table.

e) Data Privacy:

No user data is stored permanently. The document is generated in real-time and is not saved on the server, ensuring user privacy.

2. Non-Functional Requirements:

a) Performance: The document should be generated within 30 seconds.

b) Usability: The interface should be simple so that even a person without legal knowledge can use it.

c) Reliability: The system should generate accurate legal language without errors.d) Scalability: The FastAPI backend can handle multiple users at the same time.

3. Technical Stack:

Frontend: Streamlit (for user interface)

Backend: FastAPI (Python)

AI Model: Google Gemini 1.5 Pro API

Libraries: python-docx, fpdf2, python-dotenv

4. Hardware and Software Requirements:

Hardware: Standard PC with 4GB RAM, Internet Connection

Software: Web Browser (Chrome), Python 3.9+, Google API Key

5. Constraints: The output depends on the quality of the prompt. The system does not provide legal advice, it only generates a draft based on templates and AI. The user should review the document with a legal expert before final use.
