PHASE 6. PROJECT TESTING PHASE

The Project Testing Phase is carried out to verify that the developed system functions correctly and satisfies the specified requirements. Various testing activities are performed to identify errors and improve the overall quality of the system.

6.1 Unit Testing

Description: Unit Testing checks each individual module or component separately to ensure that it performs its intended function correctly.

Objective: To identify and correct errors within individual modules at an early stage.

6.2 Integration Testing

Description: Integration Testing checks whether the different modules of the system work together correctly and exchange data properly.

Objective: To ensure smooth communication and proper data flow between integrated modules.

6.3 System Testing

Description: System Testing evaluates the complete system as a single unit under different conditions.

Objective: To verify that the entire system meets the specified functional and performance requirements.

6.4 User Acceptance Testing

Description: User Acceptance Testing is performed to check whether the system meets the actual needs and expectations of the users.

Objective: To confirm that the system is suitable for real-world use and satisfies user requirements.

6.5 Bug Fixing

Description: Bug Fixing involves identifying errors found during testing and making the necessary corrections.

Objective: To remove identified errors and improve the reliability and stability of the system.

6.6 Final Testing

Description: Final Testing is conducted after all major errors have been corrected to verify the overall functionality of the system.

Objective: To ensure that the system is reliable, accurate, and ready for final implementation.
